

Hi Dean,

In terms of the works involved in the RPA of T11 – T14 my report covers how this will be addressed, opening the ground initially with hand tools and under arboricultural supervision. Because the trees are on a slightly higher ground level, its feasible most of the rooting mass will be focused on the upper level where moisture and gaseous exchange will be better for them.

I can supervise any excavation works in this area as part of the ongoing arboricultural supervision, ensuring any roots encountered are suitably protected and covered.

We can look to book this in accordingly when the works are proposed to take place.

Kind Regards

Andrew Day

Arboricultural Consultant
