

Hi Lisa,

Can I confirm the below has been received and re-consultation on the EIA screening request will commence soon? The Applicant has provided additional information regarding air quality, supplementary to the below email:

“A minimal quantity of hydrogen may be vented from the electrolyser during normal operation, e.g., when the system is purged for maintenance. Oxygen produced as a by-product of the electrolysis process will be vented to atmosphere pending a suitable market for capture and re-use being established.”

Kind regards,

Becky Little (She/Her)
