Bespoke compensation agreed for losses of VHDH or irreplaceable habitat	User comments
	Area of bare ground in the far southern section of the site with a low amount of ephemeral / short perennial vegetation.
	Strip of modified grassland which runs between an area of mixed scrub for the majority of the length as well as a gravel area with stored equipment and vehicles in the southern section. The grassland comprises a short sward, with species including perennial rye-grass, annual meadow-grass, common cat's-ear, cut-leaved crane's-bill, spotted medick and common mouse-ear. The grassland passed the following criteria on the condition assessment: A (6 species per m2 on average), C, F and G and failed the following criteria: B (predominantly short sward), D (evidence of compaction and disturbance in places) and E (cover of bare ground amounts for approximately 20%). The following species were recorded on the first quadrat: bristly oxtongue, spotted medick, perennial rye-grass, annual meadow-grass, common cat's-ear and cut-leaved crane's-bill, and the following on the second quadrat: cut-leaved crane's-bill, perennial rye-grass, spotted medick, common mouse-ear and annual meadow-grass. A portion of this grassland will be lost to provision for relocated buildings as part of camping facilities and a new access track/pathway leading to additional camping facilities in the northern section of the site.
	Existing stable building, which is likely to be repurposed and relocated as part of the proposed development.
	Area comprises a mixture of developed land sealed surface, unvegetated unsealed surface, and shipping containers. This land will be repurposed to provision for the relocated/repurposed camping facilities, amenity grassland and associated access footpaths.

	Existing concrete access track, which will be integrated as part of the new campsite development.
	Area of modified grassland to the north of the existing access track which continues eastwards and northwards to border an area of mixed scrub in the northern section of the site. The grassland forms part of a larger field which is currently grazed, and some scattered scrub is also present. The following species were recorded in quadrat 1: lesser trefoil, dove's-foot crane's-bill, annual meadow-grass, sticky mouse-ear, thyme-leaved speedwell and red fescue (8 species). In quadrat 2:common ragwort, sweet vernal-grass, Yorkshire fog, squirrel-tail fescue and white clover (5 species). In quadrat 3: squirrel-tail fescue, common mouse-ear, self-heal, Yorkshire fog, perennial rye-grass, soft brome, fat hen, common cat's-ear and annual meadow-grass (9 species). The grassland passed the following criteria in the condition assessment: A (average of 7 species per m2), C, F and G and failed the following criteria: B (predominantly short sward), D (evidence of compaction and disturbance from grazing animals) and E (bare ground accounts for approximately 20% of the area). A portion of the grassland will be lost to facilitate a new permeable access track, car parking area and pathways for the campsite. Furthermore, planting of native scrub will take place in the main section of the grassland field in the western section of the site.
	Area of mixed scrub which runs along the central section of the site to the northern site boundary where there is a wider section. Species present include a mixture of wild plum, elder, hawthorn, bramble, common nettle, common ivy, hemlock and sycamore. The scrub failed the following criteria on the condition assessment: C (common nettle and hemlock comprises >5% of the ground cover) and D (the scrub borders modified grassland along most of the edges) and passed the following criteria: A, B and E. A portion of the scrub will be lost to facilitate new glamping facilities, including new buildings and associated access pathways.

	Area of neutral grassland with tall forbs which has developed in a formally cleared area within dense scrub. The habitat has been encroached by ephemeral species which are indicative of high nutrient status such as common nettle, burdock, spear thistle, hemlock, teasel and bramble. Other species present in lower abundances include weld, imperforate St. John's-wort, red clover, creeping buttercup, and common cat's-ear. However, the dominant species are indicative of low species diversity and abundance. The grassland failed the following criteria in the condition assessment: A (general lack of characteristic species associated with higher-quality grassland), E (proportion of sub-optimal species such as common nettle comprise >5% of the total area) and F (average of 6 species per m2) and passed the following criteria: B, C and D. A portion of the grassland will be lost to facilitate new glamping facilities, including new buildings and associated access pathways.

0.00	Newly installed access track and footpaths to provide access to the proposed camping/glamping facilities in different parts of the site along with a new parking and turning area. The new access track and driveway will comprise gravel set into a cellular system, and the newy pathways will comprise a self-binding gravel path. This intersects sections of the existing modified grassland, mixed scrub and neutral grassland habitats onsite.
0.00	Combined area of relocated/repurposed buildings and newly constructed glamping pods, including the adjoining decking areas.
0.00	Combined areas of mapped 'Other developed land', including barrel sauna pods and cold plunges associated with the Finman Retreat in the northern section of the site.
0.98	The creation of a large area of modified grassland across the site which will form the main part of the amenity area of the campsite. It is anticipated that this grassland will form a lawn that is regularly mown to provision for access / recreation / aesthetic purposes. Despite the management, it is possible to sow a mix of forbs and grass species to allow the grassland to reach good target condition in terms of the 6 species per m2 threshold.

0.65	Creation of four main areas of wildflower grassland to be sown with an EM1 grass seed mix, including a strip adjacent to the newly created area of scrub and several areas adjacent to the lodges and associated pathways in the far southern section of the site. The grassland will be subject to a more sympathetic management approach compared to the areas of modified grassland, with a staggered cutting regime to provide areas of taller sward heights and a diversity of tall forbs through targeted seeding of key indicator species associated with neutral grassland and wildflower meadows, for example common knapweed and oxeye daisy.
1.37	The creation of a new area of scrub which would be expected to reach moderate target condition, through the planting of a native shrub mix with species such as hawthorn, blackthorn, hazel, holly and goat willow. This area will form a key habitat feature in the western section of the site, located adjacent to the newly created car park and wildflower meadow.
0.23	The planting of seventeen small trees which would be expected to reach moderate target condition. The trees will be planted throughout different locations within the site, however principally in proximity to the lodges in the southern and northern sections of the site. Trees will also be planted within two of the newly planted hedges onsite.
