Introduction

This Flood Risk Assessment and Drainage Strategy has been developed in support of a planning application for residential development of up to 67 new homes located at Woodlands Farm, Wrotham Road, Meopham, Kent, DA13 0RQ. This document aims to identify any flood risk areas, offering suggested mitigation where appropriate and also outline the methods of drainage available for both Surface Water and Foul Water Drainage. A Location Plan and layout of the proposed scheme can be found in the appendices of this document.

Due to the area of development being over 1 Hectare the site is subject to a formal Flood Risk Assessment (FRA), which is to be submitted and approved by the Local Planning Authority in consultation with the Statutory Consultees.

Development Description and Location

The proposal is for the benefit of residential development of up to 67 new homes located at Woodlands Farm, Wrotham Road, Meopham, Kent, DA13 0RQ. The site is situated within the district of Gravesham.

The location of the proposed site is at grid reference 563478, 162215 as shown in the location plans within the appendices.

Development Classification

The flood risk vulnerability classification for this type of development in this location is considered as More Vulnerable which is defined in Table 2 of the Technical Guidance to the National Planning Policy Framework.

Sequential Test

As set out in the National Planning Policy Framework, the aim of the Sequential Test is to direct new development to areas with the lowest probability of flooding.

The starting point to the Sequential Test is the Flood Zones, which can be seen below and in the appendices. The map clearly shows flood zone 1 only. However, recent changes to the NPPF states under paragraph 175 *"The sequential test should be used in areas known to be at risk now or in the future from any form of flooding, except in situations where a site-specific flood risk assessment demonstrates that no built development within the site boundary, including access or escape routes, land raising or other potentially vulnerable elements, would be located on an area that would be at risk of flooding from any source, now and in the future (having regard to potential changes in flood risk)."*

However, Planning Practice guidance goes on to say in relation to Paragraph 175 of the NPPF that in applying paragraph 175 a proportionate approach should be taken. Where a site-specific flood risk assessment demonstrates clearly that the proposed layout, design, and mitigation measures would ensure that occupiers and users would remain safe from current and future surface water flood risk for the lifetime of the development (therefore addressing the risks identified e.g. by Environment Agency flood risk mapping), without increasing flood risk elsewhere, then the sequential test need not be applied.

The proposed development is classified as More Vulnerable in accordance with Table 2 of the Technical Guidance to the National Planning Policy Framework and is identified within the below matrix as "Appropriate Development" as the site lies entirely within Flood Zone 1. Accordingly, this report will identify and assess any mitigation measures required to ensure that the development, along with its occupants and users, remains safe from both current and future surface water flood risk over its lifetime. Therefore, the sequential test need not apply.

Table 3: Flood risk vulnerability and flood zone 'compatibility'

Flood risk vulnerability classification (see table 2)		Essential infrastructure	Water compatible	Highly vulnerable	More vulnerable	Less vulnerable
Flood zone (see table 1)	Zone 1	✓	✓	✓	✓	✓
	Zone 2	✓	✓	Exception Test required	✓	✓
	Zone 3a	Exception Test required	✓	×	Exception Test required	✓
	Zone 3b functional floodplain	Exception Test required	✓	×	×	×

Key: ✓ Development is appropriate.
× Development should not be permitted.

The table above also confirms that the development in this instance is considered appropriate development.

Definition of the Flood Hazard

For the preparation of this Flood Risk Assessment, it is necessary to consider all of the potential sources of flooding and how this may affect the site. A checklist has been provided below to help identify these areas which can be discussed in greater detail below.

Possible Source of Flooding	Applicable to this Site?
Fluvial Flooding from nearby rivers or streams	☒
Coastal Flooding	☒
Surface Water Runoff from the Site, Adjacent or Nearby Land	☒
Flooding from Surface Water Sewers	☒
Flooding from Foul Water Sewers	☒
Flooding from Reservoirs	☒
Flooding from Groundwater	☒
Flooding from other Sources	☒

Fluvial flood maps have been checked (contained within the appendices) which show no risk of flooding from nearby rivers or streams.

There is no coastal flood risk to the proposed site as the nearest coastline is approximately 29.5km away from the development.

Surface water flood maps have been checked (also contained in the appendices) which show there to be no risk of surface water flooding to the development site.

A review of the Southern Water Sewer Asset Plans (contained within the appendices) identifies an existing foul sewer running through the field opposite the site. In addition, Google Street View imagery shows a series of highway gullies along Gravesend Road, indicating the likely presence of an existing highway drainage system serving the area adjacent to the development site.

When checking the flood maps for planning in relation to reservoir flooding, the maps show there to be no risk of flooding from this source.

Upon review of the Gravesham Water and Flood Risk Background Paper, no records of groundwater flooding have been identified within close proximity of the proposed site.

There are no other sources on or off site that are thought to be a flood risk at this site.

Probability

The proposed development is situated within Zone 1 which can be seen in the Flood Maps for Planning, contained in the appendices.

The District Council for the area have prepared a Strategic Flood Risk Assessment which refines the information provided by the Environment Agency and gives an overview of the flood risk in the district.

Based on the Information provided in both the Flood Maps for Planning and the Strategic Flood Risk Assessment, the probability of a flood event may be taken as:
Zone 1 - Land having a less than 1 in 1,000 annual probability of river or sea flooding. (Shown as 'clear' on the Flood Map – all land outside Zones 2 and 3)

Climate Change

More recent guidelines have been published in respect of climate change allowances. Climate change allowances have been applied to the rainfall simulations for the benefit of the drainage design, in accordance with LLFA policies.

Flood Risk Management Measures

Although the entirety of the development is situated within an area of flood zone 1, the EA state that PLP (property level protection) measures can be the most effective in mitigating both the ingress of water to a property and help to minimise damage should water get in.

Therefore, the internal finished floor levels (FFLs) of the proposed dwellings will be set at a minimum of 150mm above the adjacent external ground levels.

The property owner should consider installing non-return valves in the new foul drainage systems to prevent any potential surcharging. This will also help prevent issues with rodents.

Off Site Impacts

There are no foreseen adverse residual impacts to neighbouring buildings or the surrounding area in relation to flood risk as a result of the proposed development scheme.

Residual Risks

There are no additional residual flood risks to the property following the implementation of the flood risk management measures.

Drainage Strategy

Existing Drainage

Upon review of the topographical survey, it can be seen that there are other exiting drainage systems in the vicinity of the new building. These are all understood to be private drainage assets and will be decommissioned as part of any re-development work.

Site Geology

Local geotechnical mapping has been checked, which shows that the bedrock geology consists of the Lewes Nodular Chalk Formation. This formation type is generally described as:

Lewes Nodular Chalk Formation

''Composed of hard to very hard nodular chalks and hardgrounds with interbedded soft to medium hard chalks''

On the basis of the above, this would indicate that infiltration to ground is likely to be viable.

Topography

A topographical survey has been carried out which shows the external ground levels at the front of the site to be around 184.20mAOD. Site levels then continue to increase towards centre of the site at approximately 186.50mAOD. From here the levels gradually increase to 189.30mAOD at the Southern side of the site.

Design Objective

The objective of the design will be to;

a) Retain/reduce the quantity of surface water runoff leaving the development area, to equal or less than the greenfield runoff rate for all storms, up to and including the 1 in 100 year return period + 45% climate change.
b) Improve the quality of surface water runoff by infiltration methods and open SUD's wherever possible.

Surface Water Drainage Considerations

When making selections in respect of the final discharge point of the surface water drainage, the hierarchy of SUDS must be considered in the decision-making process and shall be implemented in the development of the drainage strategy where this is reasonably achievable.

For surface water drainage runoff destinations, the hierarchy of SUDS now states the following, in priority order as follows:

- Priority 1: collected for non-potable use
- Priority 2: infiltrated to ground
- Priority 3: discharged to an above ground surface water body
- Priority 4: discharged to a surface water sewer, or another piped surface water drainage system
- Priority 5: discharged to a combined sewer

Where it is not possible to implement the higher priority choices in the hierarchy, evidence may need to be submitted to demonstrate how and why these elements cannot be complied with.

Whilst the SUDS National Standards set out the criteria for prioritising these choices, there may also be circumstances where a departure from these standards can be agreed at a local level if the reasons given are able to demonstrate that the implementation of higher priority selections are not reasonably practicable.

It should also be noted that that there may be scenarios where more than one of these priority selections are made, to present a hybrid strategy for surface water management.

For this proposed development, the hierarchy of SUDS has been given due consideration, which can be reviewed in other sections in this document, such as Site Geology, Existing Drainage.

The following discharge priorities have been selected in the table on the next page:

Priority Selection

Priority Rating	Description	
1	Collected for non-potable use	☒
2	Infiltrated to ground	☒
3	Discharged to an above ground surface water body	☐
4	Discharged to a surface water sewer, or another piped surface water drainage system	☐
5	Discharged to a combined sewer	☐

Consideration between simulated climate change adjusted critical storms in the 1 in 100 year return storm versus the ongoing functionality of a rainwater harvesting strategy, using Standard Average Annual Rainfall statistics (SAAR) need to be given where rainwater harvesting is being used.

Whilst the surface water drainage design is being assessed against low probability storms, resulting in high production of surface water runoff, the rainwater harvesting philosophy cannot be designed in the same way, as it must be based on the standard annual average rainfall, giving a smaller than expected yield.

Therefore, it is likely that in most cases, the rainwater harvesting proposals will be smaller scale proposals for each scheme, but cumulatively over many schemes will begin to make a positive difference to the existing drainage networks.

Rainwater harvesting has been duly considered in accordance with the SuDS hierarchy, and the development should incorporate rainwater butts or SuDs Planters to facilitate the reuse of roof runoff for irrigation within the soft landscaped areas of the site.

Development Drainage Proposals

Surface Water Drainage

The proposed surface water drainage strategy for the Woodlands Farm development has been developed in accordance with the National Standards, for Sustainable Drainage Systems drainage hierarchy, with infiltration identified as the preferred method of disposal.

Surface water runoff from the impermeable areas of the development (Roads, private driveways and roof areas) will be conveyed via a network of swales and attenuation basins before discharging into a series of deep bore soakaways. All attenuation basins have been modelled with a factor of safety of 2.

Ground investigation and infiltration testing have not been undertaken at the site at this early stage, and as such, infiltration rates have been assumed for the purposes of the drainage strategy.

The infiltration rate for the deep bore soakaways has been assumed at 3.85×10^{-5} m/s, based on rates achieved at a development with similar local geology. The strategy has therefore been designed to discharge directly into the Chalk formation, providing a sustainable means of surface water disposal whilst ensuring the development does not increase flood risk either on-site or elsewhere. Borehole and BRE365 infiltration testing should be undertaken prior to detailed design to confirm the suitability of the proposed infiltration rate.

The FLOW calculations also include an assumed partial infiltration rate of 1×10^{-6} m/s for the permeable driveways and SuDS basins. This rate will be reviewed and updated following completion of on-site BRE365 infiltration testing.

Water Quality

Part of the design process is to consider all aspects of water quality to ensure the appropriate levels of treatment are being implemented and that there are no adverse effects occurring to off-site areas.

When considering potential sources of pollution and their respective methods of treatment and mitigation, the CIRIA SuDS Manual 2015 (C753) provides guidance on how this can be assessed and mitigated appropriately.

The tables below are provided to ensure and check that the design methodology and treatment systems have been considered to adequately mitigate against the pollution hazard.

Total SuDS Mitigation Index (for each contamination type)	≥	Pollution Hazard Index (for each contaminant type)

TABLE 26.2 Pollution hazard indices for different land use classifications

Land use	Pollution hazard level	Total suspended solids (TSS)	Metals	Hydro-carbons
Residential roofs	Very low	0.2	0.2	0.05
Other roofs (typically commercial/ industrial roofs)	Low	0.3	0.2 (up to 0.8 where there is potential for metals to leach from the roof)	0.05
Individual property driveways, residential car parks, low traffic roads (eg cul de sacs, homezones and general access roads) and non-residential car parking with infrequent change (eg schools, offices) ie < 300 traffic movements/day	Low	0.5	0.4	0.4
Commercial yard and delivery areas, non-residential car parking with frequent change (eg hospitals, retail), all roads except low traffic roads and trunk roads/motorways[3]	Medium	0.7	0.6	0.7
Sites with heavy pollution (eg haulage yards, lorry parks, highly frequented lorry approaches to industrial estates, waste sites), sites where chemicals and fuels (other than domestic fuel oil) are to be delivered, handled, stored, used or manufactured; industrial sites; trunk roads and motorways[3]	High	0.8[2]	0.8[2]	0.9[2]

For the site located at Woodlands Farm, the consideration will be for the residential roof areas, which are considered a 'Very Low hazard'.

TABLE 26.3 Indicative SuDS mitigation indices for discharges to surface waters

	Mitigation indices[1]		
Type of SuDS component	TSS	Metals	Hydrocarbons
Filter strip	0.4	0.4	0.5
Filter drain	0.4[2]	0.4	0.4
Swale	0.5	0.6	0.6
Bioretention system	0.8	0.8	0.8
Permeable pavement	0.7	0.6	0.7
Detention basin	0.5	0.5	0.6
Pond[4]	0.7[3]	0.7	0.5
Wetland	0.8[3]	0.8	0.8
Proprietary treatment systems[5,6]	These must demonstrate that they can address each of the contaminant types to acceptable levels for frequent events up to approximately the 1 in 1 year return period event, for inflow concentrations relevant to the contributing drainage area.		

By using catchpits and silt traps, this should be deemed appropriate mitigation for the SUDS design.

Foul Water Drainage

An existing public foul sewer is located on the opposite side of Wrotham Road and will serve as the proposed point of connection for the development's foul drainage. A foul pumping station will be installed to convey foul flows from the site to the public sewer, which is likely to be via a S98 agreement under the Water Industry Act to enable the connection to the off-site foul sewer. The proposed arrangement is shown on Drawing RSPD 6348-01 Drainage Strategy.

Residual Flood Risk

There are no foreseen adverse residual impacts to neighbouring properties or the surrounding area in relation to flood risk as a result of the proposed development scheme.

Future Maintenance

Maintenance regimes of the various drainage methods will vary, depending on the development proposals and surroundings. However, a general guide to the maintenance of the various methods of drainage have been provided below;

Maintenance Catch pits and Flow Control Chambers

To ensure the long-term effectiveness of the surface water collection asset, the sediment that accumulates within the sump of the catch pit or flow control chamber must periodically be removed to prevent it from entering the rest of the network. The frequency of this maintenance operation will vary depending on the density of the site, vegetation, design of the drainage system, other permeable areas and if the site is pre or post construction.

The ongoing maintenance activities for this system are tabulated on the following page in Table 1.

Table 1 – Catch Pit & Flow Control Chamber Maintenance – By Management Company

Maintenance Activity	Remedial Action	Inspection Frequency	
Inspect Linear Drainage Grating.	Ensure the grating had not been covered with mud or any other detritus, to ensure the ongoing effectiveness of the collecting grill. Sweep clear as necessary Also check the condition of the grating to ensure there are no damaged components. Replace as required.	Pre-completion	Monthly
		Post completion – up to 1 year	Quarterly
		On-going	Annually
Inspect Gullies, Sumps and Catch-pits	Clear any sediment or detritus found in the chamber/s. If sediment has built up within the pipe network, this should be cleared with rodding equipment or professional jetting techniques.	Pre-completion	Monthly
		Post completion – up to 1 year	Quarterly
		On-going	Annually

Foul Water Pumping Station

The proposed foul pumping station will be subject to a planned inspection and maintenance regime to ensure its continued efficient operation. Routine visits will include inspection of pumps, pipework, valves and control panels, together with cleaning of the wet well to prevent the build-up of debris, fats or silt. Pump performance, float switches and telemetry systems will be checked and tested to confirm correct operation, with any worn components replaced as necessary.

Maintenance will be undertaken by a suitably qualified contractor in accordance with the manufacturer's recommendations to ensure the long-term reliability of the system and to minimise the risk of blockage or mechanical failure.

Maintenance of Swales and Basins

There will be a new basin that is situated within the proposed development, which will allow development water to pass through it before entering the soakaways.

The ongoing maintenance activities for these basins are tabulated below in Table 3.

Table 3 – Basin Maintenance Activities – By the development management company.

Maintenance Activity	Remedial Action	Inspection Frequency	
Inspect basin perimeter for Litter and debris	Remove litter and debris with appropriate tools and dispose to the appropriate facility.	Pre-completion	Monthly
		Post completion – up to 1 year	Quarterly
		On-going	Annually or as required
Inspect vegetation for even growth and retained height.	Re-seed where necessary and cut back meadow grass etc.. outside of bird nesting seasons.	Pre-completion	Half Yearly
		Post completion – up to 1 year	Half Yearly
		On-going	Half Yearly
Inspect channel and discharge points for erosion.	Repair any affected areas by replacing any lost soil and re-turfing where necessary.	Pre-completion	Quarterly
		Post completion – up to 1 year	Quarterly
		On-going	Annually or as required
Inspect outlet pipes and culverts for sediment build-up.	Remove any excess sediment from the pipes/culverts with drainage rods and/or professional jetting techniques.	Pre-completion	Monthly
		Post completion – up to 1 year	Quarterly
		On-going	Annually or as required
Inspect main water body for sediment build up.	Remove excess sediment build up when pool volume is reduced by up to 20%. Clearance is normally every 10 – 20 years.	Pre-completion	Monthly
		Post completion – up to 1 year	Quarterly
		On-going	Annually or as required
Inspect main water body signs of eutrophication.	Aerate basin if signs of eutrophication are detected.	Pre-completion	Monthly
		Post completion – up to 1 year	Monthly
		On-going	Monthly

Conclusion

Roads & Sewers for Planning & Design Ltd (RSPD) have been requested to provide a Flood Risk Assessment and Drainage Strategy for the benefit of commercial development located at Woodlands Farm, Wrotham Road, Meopham, Gravesend, Kent, DA13 0RQ. This document aims to identify any flood risk areas, offering suggested mitigation where appropriate and also outline the methods of drainage available for both Surface Water and Foul Water Drainage. A Location Plan and layout of the proposed scheme can be found in the appendices of this document.

Due to the area of development being over 1 Hectare the site is subject to a formal Flood Risk Assessment (FRA), which is to be submitted and approved by the Local Planning Authority in consultation with the Statutory Consultees.

The flood risk vulnerability classification for this type of development in this location is considered as More Vulnerable which is defined in Table 2 of the Technical Guidance to the National Planning Policy Framework.

Based on the Information provided in both the Flood Maps for Planning and the Strategic Flood Risk Assessment, the probability of a flood event may be taken as:

Zone 1 – Low Probability, as it has a 1 in 1000 annual probability or less of river flooding, ignoring the presence of existing flood defences.

Although the entirety of the development is situated within an area of flood zone 1, the EA state that PLP (property level protection) measures can be the most effective in mitigating both the ingress of water to a property and help to minimise damage should water get in.

Therefore, the internal finished floor levels (FFL) of each of the new dwellings should be a minimum 150mm above the external ground levels.

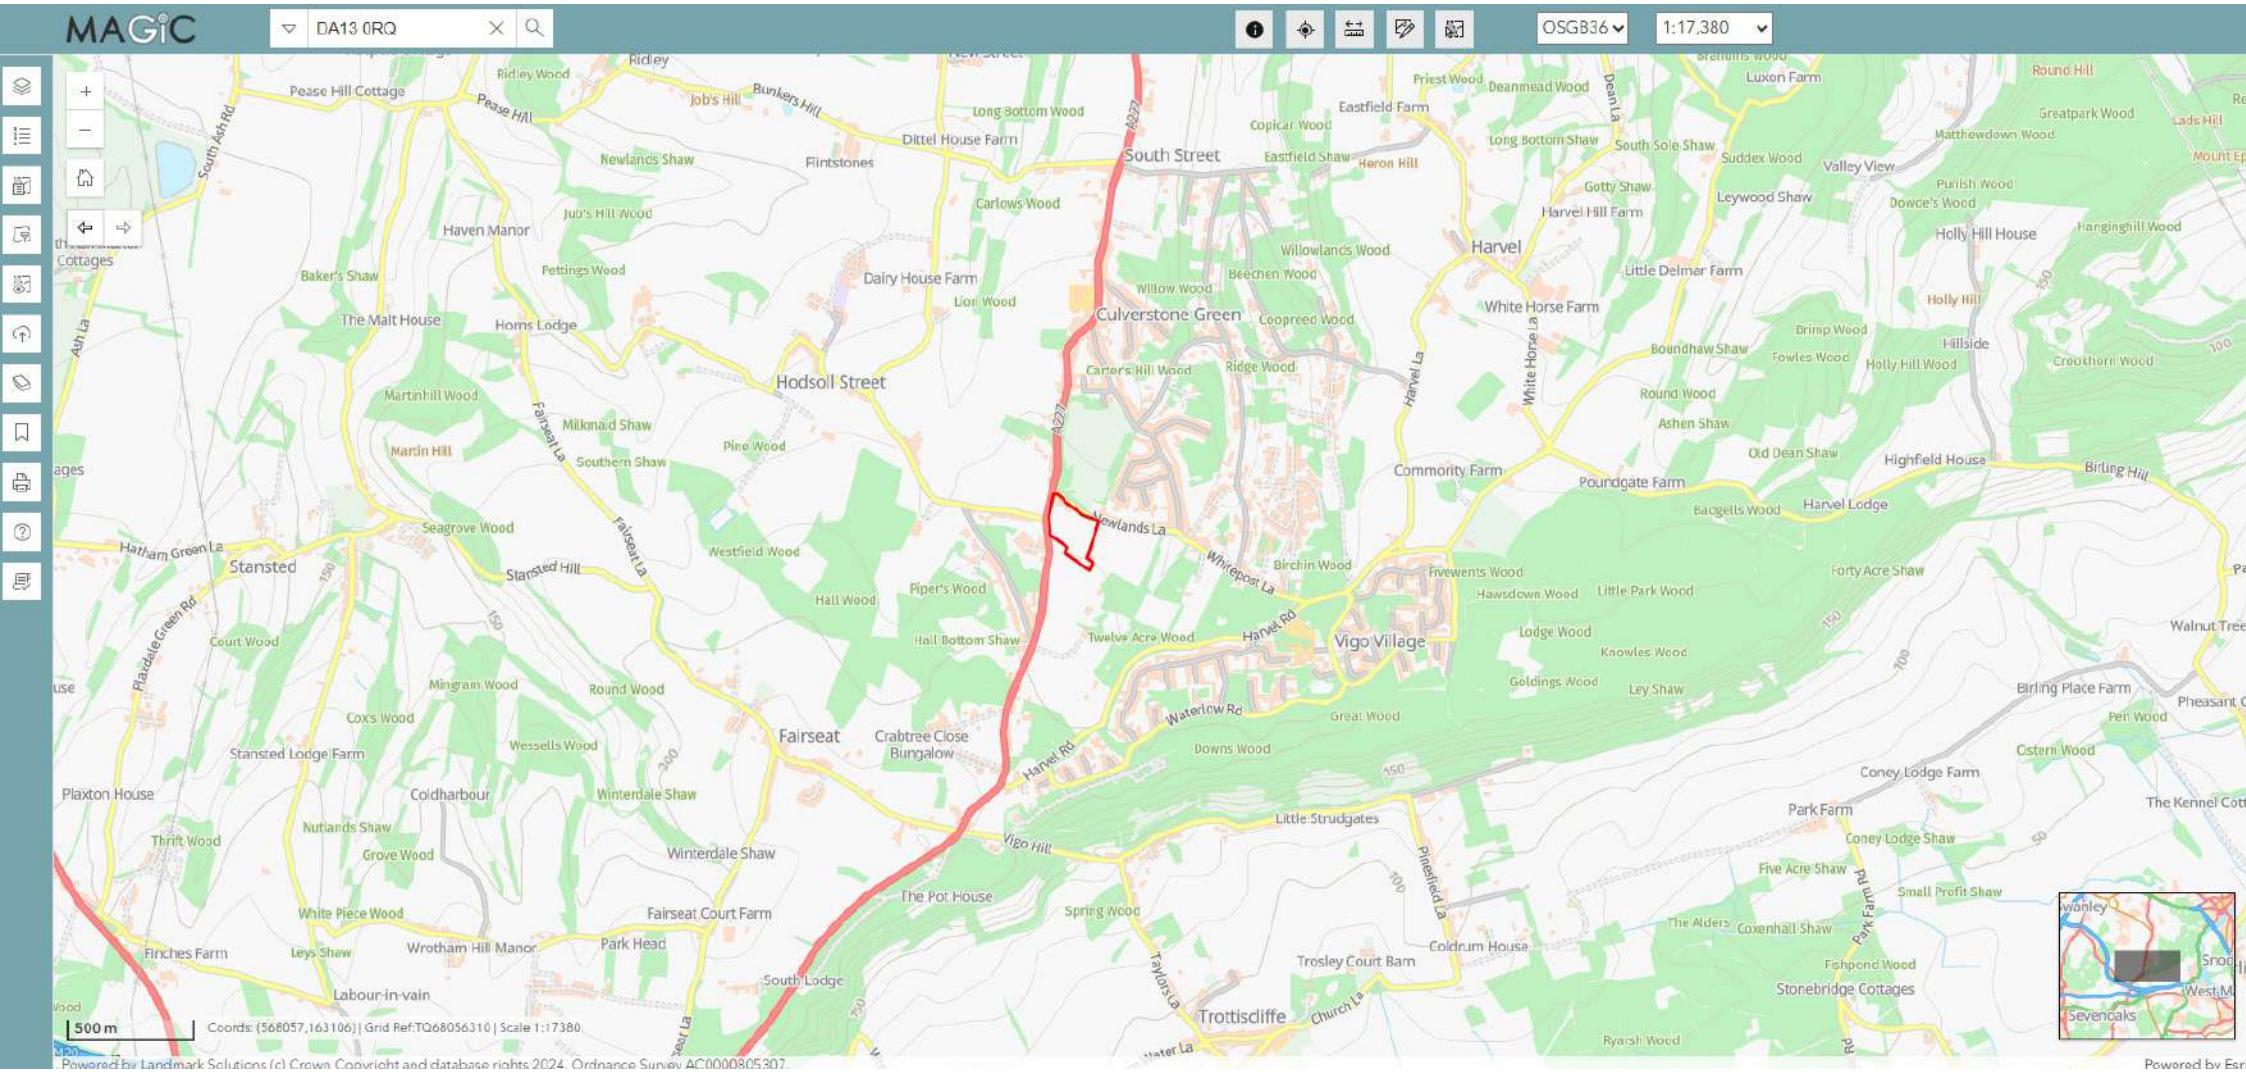
The property owner should consider installing non-return valves in the new foul drainage systems to prevent any potential surcharging. This will also help prevent issues with rodents.

The Architectural Pans (contained within the appendices) identify an existing drainage system at the site, however, a site visit is required to review the current drainage arrangement.

The proposed scheme aims to separate the existing surface water and foul water drainage systems, connecting them into their respective public sewers at Woodlands Farm, as shown in the drainage strategy drawing (RSPD 6348-01 Drainage Strategy) included within the appendices.

There is an existing public foul sewer located at the development site which is understood to have taken foul drainage from the existing site at Woodlands Farm.

There are no foreseen adverse residual impacts to neighbouring properties or the surrounding area in relation to flood risk as a result of the proposed development scheme. The scheme proposals actually show a significant benefit to managing flood risk in the area.



On the basis of the findings of this report, it is recommended that no objections should be raised to the development proposals on the grounds of flood risk.

Flood Maps for Planning

Flood map for planning

Your reference	Location (easting/northing)	Created
Unspecified	**563478/162205**	**3 July 2026 10:00**

Your selected location is in flood zone 1, an area with a low probability of flooding.

You will need to do a flood risk assessment if your site is **any of the following**:

- bigger than 1 hectare (ha)
- in an area with critical drainage problems as notified by the Environment Agency
- identified as being at increased flood risk in future by the local authority's strategic flood risk assessment
- at risk from other sources of flooding (such as surface water or reservoirs) and its development would increase the vulnerability of its use (such as constructing an office on an undeveloped site or converting a shop to a dwelling)

Notes

The flood map for planning shows river and sea flooding data only. It doesn't include other sources of flooding. It is for use in development planning and flood risk assessments.

This information relates to the selected location and is not specific to any property within it. The map is updated regularly and is correct at the time of printing.

Flood risk data is covered by the Open Government Licence which sets out the terms and conditions for using government data. https://www.nationalarchives.gov.uk/doc/open-government-licence/version/3

Use of the address and mapping data is subject to Ordnance Survey public viewing terms under Crown copyright and database rights 2026 AC0000807064. https://flood-map-for-planning.service.gov.uk/os-terms

WATER for LIFE from Southern Water

The positions of pipes shown on this plan are believed to be correct, but Southern Water Services Ltd accept no responsibility in the event of inaccuracy. The actual positions should be determined on site. This plan is produced by Southern Water Services Ltd (c) Crown copyright and database rights 2026 Ordnance Survey AC0000808122 .This map is to be used for the purposes of viewing the location of Southern Water plant only. Any other uses of the map data or further copies is not permitted.

WARNING: BAC pipes are constructed of Bonded Asbestos Cement.

WARNING: Unknown (UNK) materials may include Bonded Asbestos Cement.

Manhole Reference	Liquid Type	Cover Level	Invert Level	Depth to Invert

APPENDIX E

RSPD 6348-01 Drainage Layout REV B
RSPD 6348-06 Catchment Plan

Soakage rates have been assumed for the purposes of this drainage strategy.
Soakage testing will need to be undertaken prior to the detailed design stage

General Notes

KEY:

- Application Site Boundary
- Surface Water Drain
- Foul Water Drain
- Linear Drainage
- Pipe Protection
- SW Rising Main
- FW Rising Main
- French Drain/Perforated Pipe
- Surface Catch Pit/Manhole
- Foul Water Manhole
- Surface Water Soakaway
- Gully & Lead
- Waste Water Package Treatment Plant
- 1.2m Retaining Wall
- +153.100 Spot Levels
- Direction of Flow
- Embankment
- Brick Headwall
- Permeable Block Paving

FOR PLANNING

No.	Revision/Issue	Date
Rev B	Basins 3 & 4 upsized as CV values within the drainage calculations have been increased inline with KCC comments	23/09/26
Rev A	Foul pumping station relocated to avoid the removal of T49	07/08/26
